

1. Objectives

To add a value to our products according to Good Agricultural Practice (GAP) we require that the use of pesticides comply with the actual status of Swiss statutory requirements such as Swiss Ordinance SR 817.021.23 and the European statutory requirements such as "EU regulation 396/2005". In addition we require a limit regarding the verifiable residues of active components. Furthermore, it is not allowed to use pesticides with very critical active components in order to prevent negative influence of the environment and our employees and customers.

2. Scope

The guideline applies to all suppliers/ producers who supply products with the GAP label to Louis Ditzler AG.

3. Overall Criteria

All chemical agents used to protect the crop against disease and pest infestation are classed as pesticides. Pesticides contain active substances and other ingredients. An active substance is the component of a pesticide that is responsible for its effect.

The use of pesticides in agriculture production, post-harvest treatment, processing, storage and transport must comply with the principle "as little as possible, as much as necessary". The use of pesticides must be completely documented and the required withdrawal period must be respected.

Products labelled "BIO KNOSPE" have to be in compliance with the statutory requirements of BIO SUISSE.

All products have to comply with the actual statutory tolerance levels according to the Swiss statutory requirements such as Swiss Ordinance SR 817.021.23 and the European statutory requirements such as "EU regulation 396/2005" as well as the Ditzler guideline of pesticides. In particular, the principles of integrated plant protection shall be observed at all times (vgl. ÖLN Requirements, or the integrated Pest Management of the EU²). This means that pesticides may only be used if all other plant protection measures fail³.

4. Product specific requirements

To achieve an additional benefit GAP products have to comply with the actual following tolerances relating to the quantity of demonstrable residues of active substances of pesticides.

Product	<u>Number of residues</u> pesticides ingredients ≥ 0.01 mg/kg	
	Sensitization	Sanction
Berries, grapes	6	≥ 7
Cherries	5 – 6	≥ 7
Pome fruit, stone fruit (excluding cherries), citrus fruits, salads, fruit vegetables, fries, fresh and dried herbs, tea, dried fruits and vegetables, minimally processed fruits, vegetables and salads, milled cereal products	5	≥ 6
Exotics, cabbage, spinach, root and tuber vegetables, onion vegetables, various vegetables (excluding fruit vegetables)	4	≥ 5

5. Forbidden components

The following active substances of pesticides must not be used in agriculture production, post-harvest treatment, processing, storage and transport. This list of prohibited pesticide ingredients was compiled on the basis of the globally recognized list of the Stockholm Convention (POP), the Rotterdam Convention (PIC), and primarily on the globally recognized FAO/WHO guidelines concerning highly hazardous pesticides.
